

比較運算子

==	equal to
!=	not equal to
>	greater than
<	less than
>=	greater than or equal to
<=	less than or equal to

if-statement

1

條件 Conditions

x	power	MAX_POW	y	item	MIN_ITEM	mom_or_dad	num	SENTINEL
-5	1024	1024	7	1.5	-999.0	'M'	999	999

a number

運算子 Operator	意義 meaning	條件 condition	值 value
<=	小於或等於	$x \leq 0$	1(true)
<	小於	$power < MAX_POW$	0(false)
>=	大於或等於	$x \geq y$	0(false)
>	大於	$item > MIN_ITEM$	1(true)
==	等於	$mom_or_dad == 'M'$	1(true)
!=	不等於	$num != SENTINEL$	0(false)

if-statement

2

條件 → C表示式

1. x 和 y 都大於 z (_____)
 2. x 等於 1.0 或 3.0 (_____)
 3. x 在 y 和 z 之間 ($y < z$) (_____)
 4. x 不在 y 和 z 的範圍以內 (_____)
- 已知 $y < z$

if-statement

3

比較字符 char

	1(true)	0(false)
'9' >= '0'	1	0
'a' < 'e'	1	0
'B' <= 'A'	1	0
'Z' == 'z'	1	0
'a' <= 'A'	1	0
<code>ch >= 'a' && ch <= 'z'</code>	1	0

if-statement

4

相反條件

`m==n`

`a<=b`

DeMorgan's Theorem

complement 相反

```
(age<=25) || (status!='S' && status!='D')
```

```
!( (age<=25) || (status!='S' && status!='D') )
```

```
(age<=25) (status!='S' && status!='D')
```

if-statement

5

The **if** statement

- Syntax 語法
if (條件) 句子1 ;
else 句子2 ;

Ex-1.

```
if (heart_rate_atrest > 56 ) // 靜止心跳
    printf("keep up your exercise program!\n");
else
    printf("Your heart rate is in excellent health!\n");
```

Ex-2.

```
if (x!=0)
    product = product * x; // product 積
if (x!=0) average = total / x;
```

if-statement

6

Flow Chart 流程圖

- A diagram that shows the step-by-step execution of a control structure
 - A diamond-shape box represents a decision
 - A rectangular box represents an assignment statement or a process.

Nested 嵌套式 if Statements

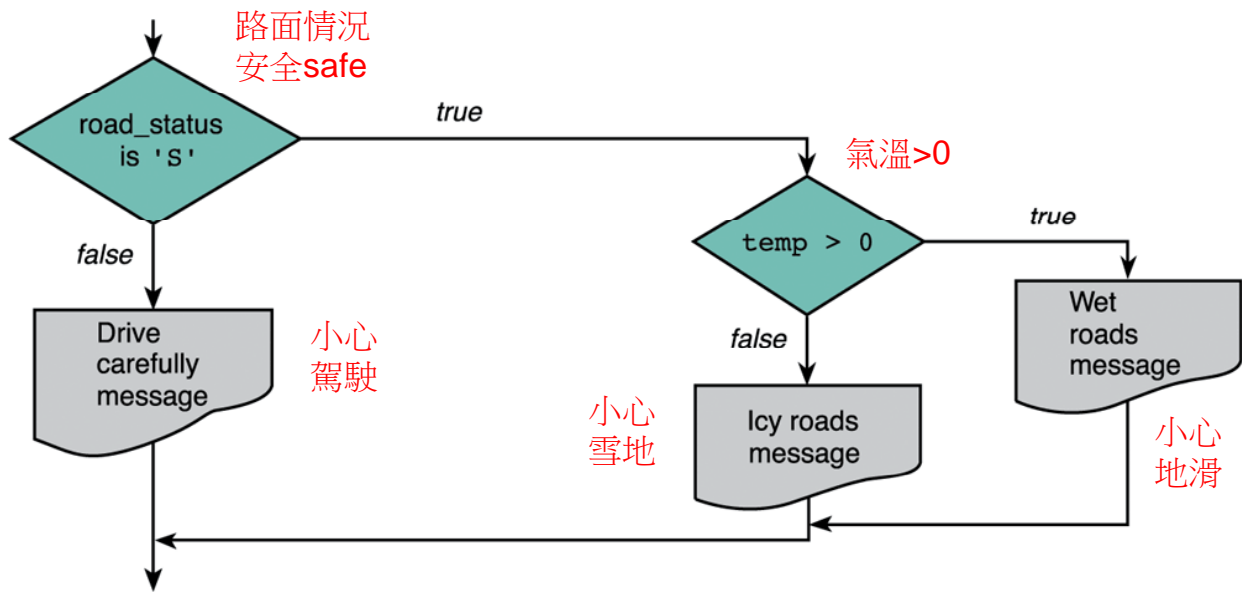

- if 中有 if
- 嵌套式

```
if (x > 0)
    num_pos = num_pos + 1;      +ve
else
    if (x < 0)
        num_neg = num_neg + 1;  -ve
    else /* x equals 0 */
        num_zero = num_zero + 1;  0
```

- Dangling else

```
if (x > 0)
if (y > 0)
    a = a + 1;
else
    b = b + 1;                // else 屬於最 的 if
```

Nested if 嵌套式 Example: Road Sign 指示 Decision Process

if-statement

Road Sign Decision Process

```

    路面狀況
    if (road_status == 'S'){
        溫度
        if (temp > 0) {
            前面路滑
            printf("Wet roads ahead\n");
            printf("Stopping time doubled\n"); 停車時間=2倍
        } else {
            路面有雪
            printf("Icy roads ahead\n");
            printf("Stopping time quadrupled\n"); 停車時間=4倍
        }
    } else
        小心駕駛
        printf("Drive carefully!\n");
  
```

if-statement

Multiple-Alternative Decision

語法

Syntax

```

if (condition1)
    statement1
else if (condition2)
    statement2
else if (condition3)
    statement3
...
else if (conditionn)
    statementn
else
    < default statement >
    
```

```

if (mm==1)
    maxdays = 31;
else if (mm==2)
    maxdays = 28;
else if (mm==3)
    maxdays = 31;
...
else if (mm==12)
    maxdays = 31;
else
    maxdays = 0;
    
```

if-statement

11

Example

```

if (a==b) printf ("Equal.");
else printf ("Not Equal.");
    
```

```

printf ("%s", (a==b) ? "Equal." : "Not Equal.");
    
```

```

b = -10;
a = (b<0) ? -b : b;
printf ("a=%i\n", a);
    
```

```

a = abs(b);
    
```

a =

if-statement

12

聘請保安員條件 (Security Guard)
填寫以下偽代碼：

犯罪紀錄：次數	0	0
性別：M/F	M	M
年齡：歲	31-45	18-30
工作經驗：年	3+	
身高：米	1.65+	1.70+

```

c1 = (犯罪紀錄_____);
c2 = (性別_____);
c3 = (年齡_____)(年齡_____)(身高_____)(工作經驗_____);
c4 = (年齡_____)(年齡_____)(身高_____);

```

```

if( (c1) && (c2) && ((c3) || (c4)))
    合資格=1;
else
    合資格=0;

```

```

if( (c1) && (c2) ){
    if ((c3) || (c4)) 合資格=1;
    else 合資格=0;
} else 合資格=0;

```

if-statement

1. Compare比較 4 input numbers:

```

if ( a > b ) x = ____; else x = ____;
if ( c > d ) y = ____; else y = ____;
if ( x > y ) max = ____; else max = ____;

```

2. Leap Year Test 潤年測試

```

int isleapyear = 0; int yy
if ( _____ || _____ )
    isleapyear=1;
else
    isleapyear=0;

```

3. 某年2月份有多少日：

```

max=28;
if ( (mm_____)(yy_____))
    max=29;

```

if-statement

```

4. 年齡age, 星期dow, 收費fare:
if( age< _____ || age> _____ )
    fare = fare/2;
if( dow== _____ || dow== _____ )
    fare = fare*2;

```

常見錯誤：

1. `if(12 < age < 60) ...`

數學與電腦寫法不同

改正: `if(age _____ age _____)`

2. `if(age < 12 || > 60) ...`

欠變數名稱 `age`

改正: `if(age _____ age _____)`

3. `if(age>60); printf("...");`

`if`中間不要加(_____)

改正: `if(age>60) printf("...");`

4. `if(age<12 && age>60) ...`

沒可能

改正: `if(age < 12 _____ age > 60) ...`

5. `if(age = 12) ...`

賦值(`age=12`)；比較(`age _____ 12`)

改正: `if(age _____ 12) ...`

if-statement

15

6. `if(age > 12 || age < 60) ...`

等同: `if(1) ...`

改正: `if(age>12 _____ age<60) ...`

7. `if(ans=='y' && ans=='n') puts("ok");`

沒可能

改正: `if(ans=='y' _____ ans=='n') puts("ok");`

8. `if(ans!='y' || ans!='n') puts("error");`

任何輸入都正確

改正: `if(ans!='y' _____ ans!='n') puts("error");`

9. `scanf("%c",&ch);`

`if(ch=='a' || 'b' || 'c' || 'd')...`

改正: `if(ch=='a' || ch=='b' || ch=='c' || ch=='d') ...`

改正: `if(strchr("abcd",ch) != NULL) ...`

if-statement
